Spring MAIL →

≡ Authenticated

≡

UI → Controller → ^{view} Form → Tag library → @ModelAttribute

{ Controller → UI } => ✓

=> Data from UI to Controller

↳ Forms → uni | Biorec ✓

↳ Query Parameter }

↳ Path Parameter → }

↳ Query Parameter :-

=> It is used to send Data from UI to controller (send data to server in URL)

=> Query Parameter must be there at the end of url

=> It will start with ?

=> Query param will represent data in the form of key-value pair ex: ?name=Anurag

Also we can add multiple query param using & separator

ex: ?name=Anurag&course=Java

==> We use @RequestParam annotation in our Spring Controller to receive Query Parameter

Path Parameter

=====

==> It is used to send Data from UI to controller (send data to server in URL)

==> Path parameter contains data directly without key (No key - value pair)

==> Path parameter can be present anywhere in url and to read path parameters we use @PathVariable annotation

```
//localhost:8486/pathmessage/Anurag/SpringBoot
@GetMapping("/pathmessage/{username}/{coursename}")
public String displaysomeMessage(@PathVariable("username")String name,@PathVariable("coursename")String course,Map<String,Object> model)
```

=> Customer - Relationship - Manager App (CRM)

prerequisites

JSP

Thymeleaf

controller

service/Business

DAO/Repository

DAO

→ save(cusmi);
→ findById(id) => findAll();
→ save(-);
→ delete(id);

1 → Register Customer

2 → Fetch Customer Details

3 → Update Customer Data

4 → Delete Customer Data

→ controller → Java class → @Controller → @RequestMapping @PostMapping
→ service → Java class → @Service
→ DAO → Spring-data-jpa
→ View → JSP, CSS, HTML

1: → Spring REST y
