

=> SpringBoot MongoDB — First half
 ↳ SpringBoot webMVC }

=> Spring REST

=> NosQL -> SpringBoot MongoDB => ↳
MySQL -> SpringBoot Data JPA => ↳

✓ Stored procedure last

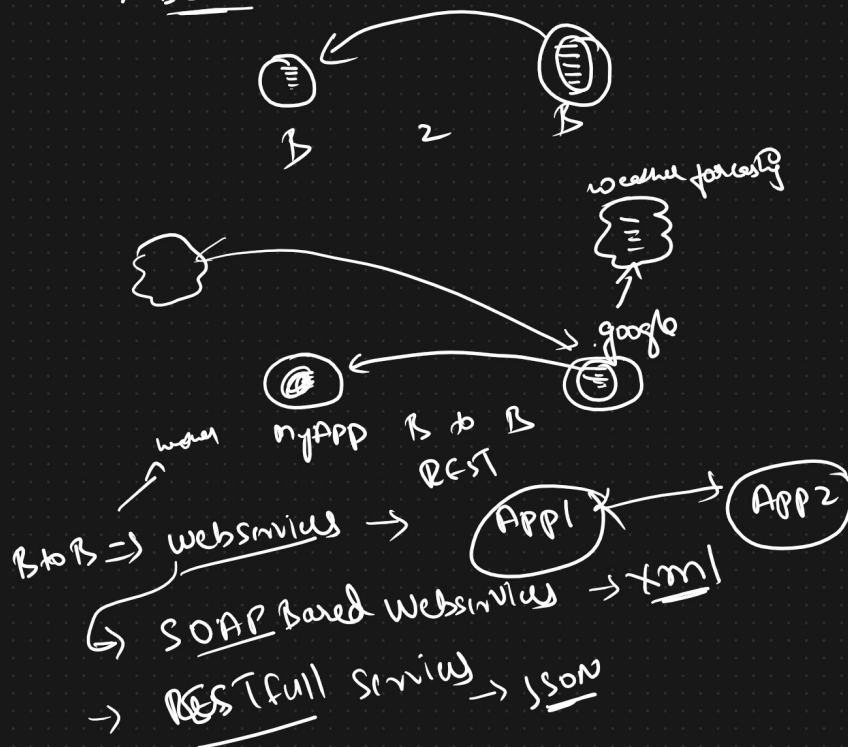

- CRUD Repo
- Paging And Sorting Repo
- JPA Repo
- MongoDB Repo
- finder method
- @Query -> custom query
- Repository -> UUID

=> Spring MVC -> Spring webMVC } -> Spring REST => ↳

=> Servlet => ↳

Spring MVC -> Spring webMVC
 ↳

-> Web Application => ↳ C<->B req & res telnet
Distributed Application
 ↳ B<->B

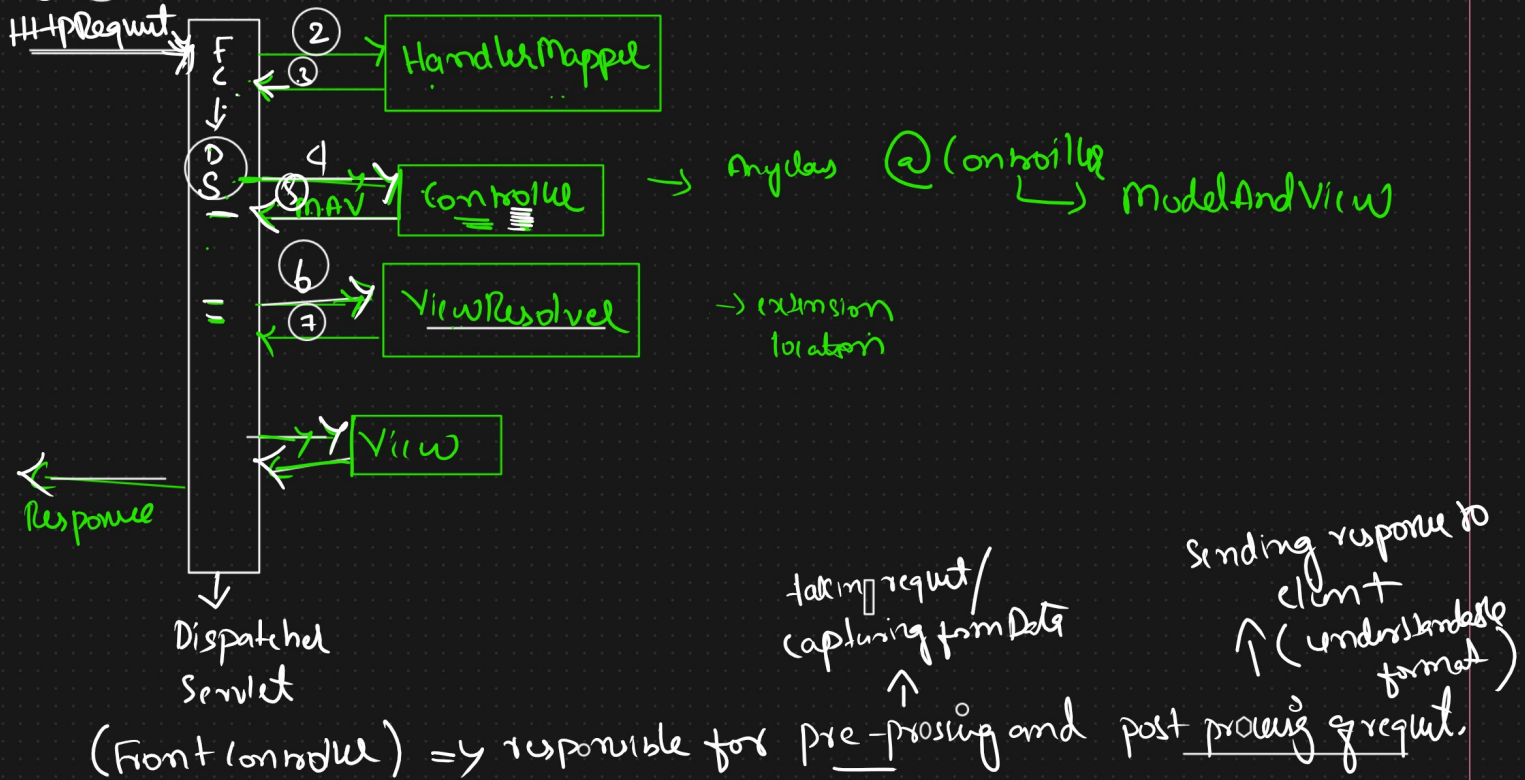

⇒ Spring web MVC → Developed → 2 Design Pattern.

- ↳ MVC Design Pattern → Architectural
- ↳ Front Controller Design Pattern. —

⇒ Spring MVC components 1-

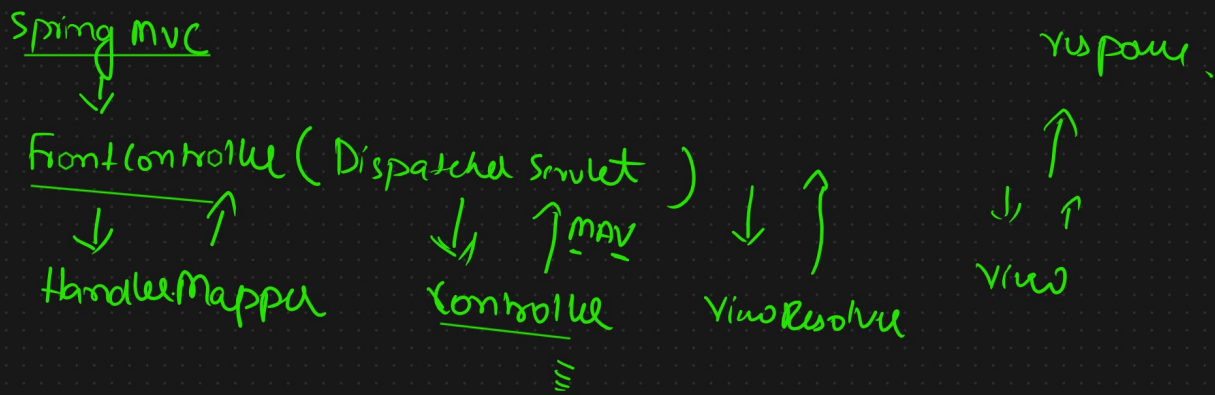

- ① Front Controller → (DispatcherServlet)
- ② Handler Mappers
- ③ Controller
- ④ ModelAndView
- ⑤ ViewResolver
- ⑥ ① View

Model → Data

view → file Name → logical view Name

MAV → ModelAndView → in Built class.

DispatcherServlet will receive Incoming HTTP Request

(DispatcherServlet) Pre defined class in Spring MVC module acting as FrontController

DS -> DispatcherServlet

DS --> send the Requested URL to HandlerMapper

HM will identify which Controller will handle the request and give back Controller details to DS

→ @RequestMapping(-)

DS will now call respective Controller

Controller will process the request and will return ModelAndView object to DS

model --> Data

view == logical file name

DS now call ViewResolver based view name received from Controller

View Resolver will identify extension and view location and this info will be sent to DS

DS will send Model data to view component

Model data will be rendered and will be sent back to DS

DS will response back to client with client understandable format view page

→ @Controller
→ @RestController

=> Dependency → Spring web

Springboot-starter-web → dependency

@Controller
