

=> Spring Rest :- 4 more classes

↳ { Java to JSON } =>

↳ spring rest

↳ Jackson API (JSON parser)

=> { JSON -> Java }

Java ==> Customer customer=new Customer(1, "Rohan", "Bengaluru", 14.5);

JSON(Light weight)

```
{
  "cid": 1,
  "cname": "Rohan",
  "ccity": "Bengaluru",
  "avg": 14.5
}
```

xml==

```
<customer>
  <cid>1</cid>
  <cname>Rohan</cname>
  <ccity>Bengaluru</ccity>
</customer>
```

HTML/CSS vs JSON

HTML/CSS==> Normal CtoB web application to display the data on browser by applying some styles which can be easily customer/end-user understandable format

JSON==> RESTful services ==> BtoB which will describe data in key-value pair can be easily consumed by other applications.

{ Java to JSON :-

{ JSON -> Java } with & without Spring Rest

converting of json-pojo(Java) and (Java)pojo-json would be a boiler plate code.

To make this even more simpler and to avoid this boiler plate code we have Spring Rest module within Spring MVC while working spring framework

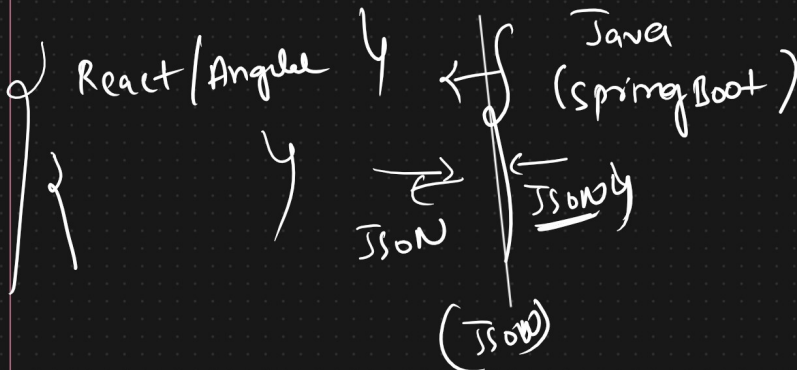

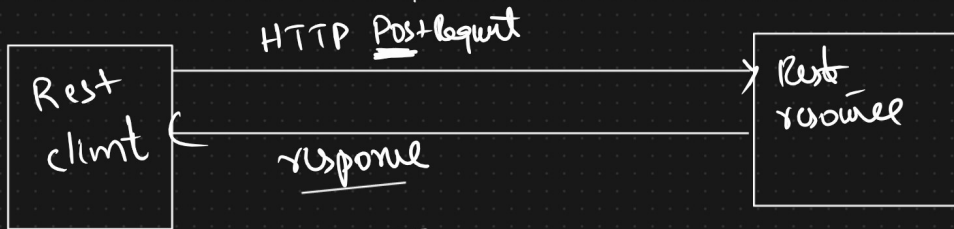

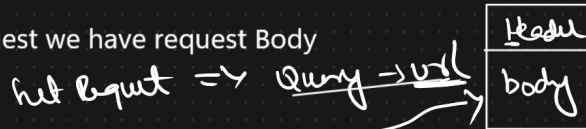

@RestController

=> { send the JSON as the response to client } ✓ a Jackson API
JSON as input in our APP a spring rest

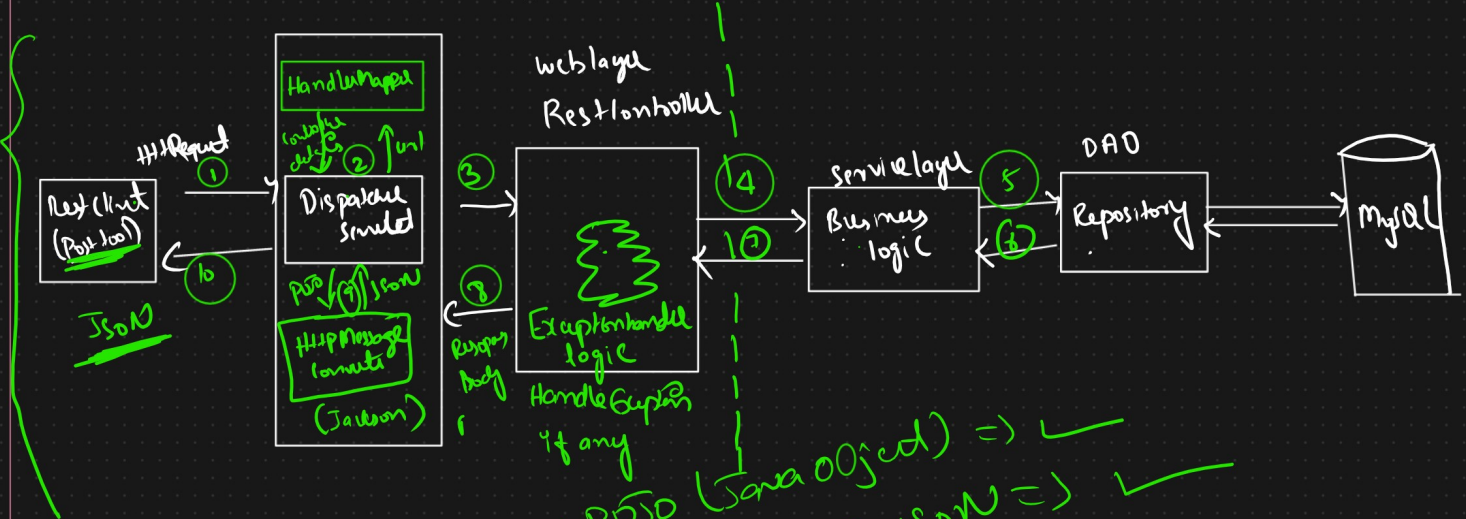

==> To Bind Rest resource method to Http Post request we have @PostMapping annotation

==> If the method is responsible to create a record at the server end by taking the data from client then we must bind our method to POST request .

==> For Post request we have request Body

==> TicketBooking Application -> B -> B (JSON)

JSON -> POJO (Java object) => ✓
Java object (POJO) -> JSON => ✓
